

Enzo Benigni, President and CEO of Elettronica

The Tempest program, the first weapon system designed as a system of systems, was conceived in the UK but represents the greatest opportunity of the century for our industry, which has to find the proper place in the system. This is an unmissable opportunity to let our country make an important technological leap, a significant enrichment in know-how and a growth of the national industrial system. It is, in short, a real "breakthrough" in terms of enabling technologies that will bring us towards a new generation of defence systems and that will allow our country to maintain the technological sovereignty conquered with the Eurofighter Typhoon. Elettronica is ready to bring its strong contribution, based on a solid track record of successes as design authority for Electronic Warfare within the Eurofighter Typhoon and the main European avionics programs of the last 30 years"
